WEIGHT FORMULA

To calculate a horse's weight, simply follow these easy steps.....

- Measure girth in inches
- Measure length in inches (point of hip to point of chest)
- Multiply Girth X Girth X Length, Divide by 300, Add 50
- Example $70'' \times 70'' \times 65'' = 318,500 / 300 = 1061.67 + 50 = 1111.67$ lbs.

This formula is accurate to +/- 3%.
